## PREFACE

This book of tables for every day use in the chemical laboratory is a revision and modification of my "Tables for Chemical Calculations" published about 16 years ago, and now out of print. The changes in our official atomic weights have made necessary a complete revision of most of the tables. A new table for facilitating the calculation of percentage compositions of organic compounds has been added, while, in order to make the book more compact and thus more convenient for its chief uses, several of the smaller, less important tables have been omitted, while the matter relating to the explanation of the tables and the illustration of their uses has been either left out or much changed and abbreviated.

The table of logarithms of numbers has been provided with a double thumb-index which is believed to be a novel and useful device. With this improvement one can turn from any place in the table to any other reference, backward as well as forward, by practically a single motion, since all indices are visible from every part of the table.

The greatest care has been used to secure accuracy in the data by the duplication, at least, of their derivation, with a complete verification after the plates were cast.

There is no doubt that accurate calculation is exceedingly important in connection with quantitative analysis and other kinds of chemical work, and it is believed that these tables will be of assistance in avoiding errors of calculation, as well as in making the work more rapid and less laborious than is often the case.

H. L. W.

# CHAPTER I

The first part of the book is devoted to a general survey of the subject. It begins with a definition of the term and a discussion of its history. The author then proceeds to a detailed examination of the various aspects of the problem, including its causes, its effects, and its possible solutions. The second part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The third part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The fourth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The fifth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The sixth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The seventh part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The eighth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The ninth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions. The tenth part of the book is devoted to a detailed study of the various aspects of the problem, including its causes, its effects, and its possible solutions.

# CHEMICAL CALCULATION TABLES

## INTRODUCTION

Five-place logarithms have been adopted in this book because they are satisfactory in usually introducing no inherent errors of calculation into the results obtained from the four-figure and five-figure numbers frequently used as data in chemical computations.

It is true that four-place logarithms will give amply accurate results for a great deal of analytical work, but as these are liable to give incorrect fourth figures in some cases the longer logarithms are to be preferred for general use. It is easy to use these with the conveniently indexed table here supplied, and they have the additional advantage that, since usually only four figures at the most are significant in the results of analytical work, these can be taken from the nearest logarithm without the trouble of interpolating for a fifth figure.

Computers should appreciate, and apply in carrying out their figures, the effects upon their results of the apparent errors of the approximate numbers employed. For general guidance in this matter the following rule may be given: Take as a basis the *smallest* number of apparently reliable figures in any of the approximate numbers used by multiplication and division (not including addition and subtraction) in producing the result. Then, if the number used for the basis begins with a smaller figure than does the result, the number of figures to be preserved in the result will usually be *equal to the basis*, while if the reverse is true in regard to the first figures the number of figures to be considered significant in the result will usually be *one more than the basis*. It should be borne in mind that zeros at the end of decimals may be apparently reliable. For example:

- a.  $23.00 \text{ -- } \times 2.5417 \text{ -- } = 58.46 \text{ -- } \quad (\text{not } 58.5 \text{ nor } 58.459)$   
b.  $0.0089 \text{ -- } \times 0.16598 \text{ -- } = 0.00148 \text{ -- } \quad (\text{not } 0.0015 \text{ nor } 0.001475)$   
c.  $0.2301 \text{ -- } \div 2.5600 \text{ -- } = 0.08988 \text{ -- } \quad (\text{not } 0.0899 \text{ nor } 0.89883)$   
d.  $\frac{0.0018 \text{ g} \times 0.8034 \text{ (factor)} \times 100}{1.6500 \text{ g (substance)}} = 0.088\% \quad (\text{not } 0.0876\%)$

This rule is by no means an absolute one, and it should be modified according to judgment. For instance, in the example *d* given above, since 88 is so much larger than the 18 from which it is derived, it might well be preferred to call the result 0.09%. In some cases it is desirable to preserve a very uncertain last figure, while in other instances it is best to omit it, but it is very bad practice to report more than one evidently uncertain figure, or to leave off or fail to calculate one or more apparently accurate ones. Attention may be called here to the importance of adding a unit to the preceding figure when a figure greater than 5 is left off.

For a more extensive discussion of the use of approximate numbers in calculations, the author's "Text Book of Chemical Arithmetic" may be referred to.

In order that accidental errors of calculation may be avoided it is recommended that entirely independent duplications of all calculations should be carried out, for mistakes are not always discovered by simply looking over the work.

In Tables II and III the logarithms are generally given, for the sake of uniformity, as though the atomic weights were exact, instead of approximate, numbers. For instance, a five-place logarithm is given for the atomic weight of boron, 11.0-- , just as though it were known to be 11.000. This feature need cause no trouble as far as the gravimetric factors are concerned, since the latter are practically always more accurate than the data to which they are applied, and hence they need not be considered in deciding upon the significant figures of the results of ordinary calculations.

The numerical formula weights in Table III in some cases have an uncertain last figure.

	Hg	200.6
For example, in the addition	S	32.06
		232.66

the last figure in the sum is uncertain because it has been obtained by addition to an unknown (plus or minus) figure. It has been preferred in most cases to retain such uncertain figures, since leaving them off and giving, for instance, HgS as 232.7 would be liable to decrease the accuracy of such formula-weights. In using these numbers for calculations it will usually make no difference whether or not the final figures are apparently accurate, but a glance at the atomic weights will show which is the case.

The student should observe that many of the numerical factors in Table II, when multiplied by 100, give percentages of constituents, and that they may often be conveniently used in this way. For example,  $\text{NaCl} \rightarrow \text{Na} = 0.39444$  shows that NaCl contains 39.44% of Na and 60.56% of Cl. Since the factor 0.39444 is derived from 23.00-- , its last figure is uncertain and has not been used in giving the percentages (compare the rule previously given).

It should be stated that the value 0.0012510 g. was adopted in Table VI as the weight of 1 cc. of nitrogen gas at 41° latitude, instead of the value 0.0012514 g. at 45° because the former latitude is more suitable for general reference in the United States, but that the change makes a difference of only about one part in 3000 and is entirely inappreciable in nitrogen determinations by the Dumas method.

*Note.* — This table is given to show a few convenient formulas for calculating the results of indirect analyses in cases where two transformations occur together. The formulas themselves may be readily derived from the proper factors by the use of algebra. For instance, for the third pair of formulas given above we have:

$$\text{NaCl} + \text{KCl} = a, \text{ and } .60656 \text{ NaCl} + .47559 \text{ KCl} = b,$$

and the solution of these simultaneous equations gives the formulas.

Of the formulas given in the table, the first two pairs represent a process that has been frequently employed, and is capable of giving good results. The student should be warned, however, against the use of most of the methods of complex indirect determination, except for the purpose of obtaining approximate results, because the errors in the determinations are largely increased in the final results. For example, the formulas indicate that an error of one part in 100 in the determination of chlorine in a mixture of NaCl and KCl would produce errors of 7.6 parts in 100 in the calculated amounts of the salts.

TABLE V.

## REDUCTION OF GAS-VOLUMES TO 0° AND 760 MM.

Vol. at 0° and 760 mm =  $v \cdot F \cdot (h-w)$ . $v$  = Volume of gas (cc); $t$  = Temperature of gas (C.°); $w$  = Tension of aqueous vapor (mm). $F$  = Factor from table =  $\frac{1}{760(1+.00367t)}$ ; $h$  = Barometer-height, corrected, (mm);

$t^\circ$	Log $F$ .*	$w$	$t^\circ$	Log $F$ .*	$w$

*Notes on Densities of Gases and Vapors.* — The molecular weight in grams of any gas or vapor has a volume of 22.4 liters at 0° and 760 mm. Hence:

$$\text{Mol. wt.} = 22.4 \times \text{wt. of 1 liter in grams.}$$

and

$$\text{Wt. of 1 liter in grams.} = \text{mol. wt.} \div 22.4.$$

In most cases the values derived from these formulas do not correspond precisely with the observed values, but they suffice for most practical purposes. For instance, the volume of 32 g. of oxygen is 22.390 instead of 22.4 l., and in other cases there is still greater variation.

It happens that the relation between grams and liters is practically the same as that between ounces, avoirdupois and cubic feet, hence:

$$\text{Wt. of 1 cu. ft. in ounces, av.} = \text{mol. wt.} \div 22.4.$$

The density of air corresponds to a mean molecular weight of 29, or more precisely 28.95 when compared with O<sub>2</sub> as 32. Hence the molecular weight of a gas or vapor divided by 29 gives its density compared with air at the same temperature and pressure. 1 l. air at 0° and 760 mm. = 1.2923 g.

TABLE IX.

## CONSTANTS FOR MOLECULAR-WEIGHT DETERMINATIONS.

(The constants are taken from Ostwald-Luther "Physiko-Chemische Messungen.")

The formula is  $M = K \frac{s}{\Delta L}$ , where  $M$  is the molecular weight of the dissolved substance,  $s$  its weight in grams,  $L$  the weight of the solvent in grams,  $\Delta$  the observed change in temperature, and  $K$  is the constant, which depends upon the nature of the solvent.

## BY DEPRESSION OF FREEZING-POINT.

Solvent.	Melts at.	K.	
		N.	Log.
Water	0°	1850	.2672
Benzole	5.5	5000	.6990
Naphthaline	80	7000	.8451
Phenanthrene	96	12000	.0792
Phenol	39	7500	.8751
Glacial acetic acid	17.7	3900	.5911
Nitrobenzole	5.3	7000	.8451
P. toluidine	42.5	5100	.7076

## BY ELEVATION OF BOILING-POINT.

Solvent.	Boils at.	K.	
		N.	Log.
Ethyl ether	35°	2160	.3345
Benzole	80	2610	.4166
Chloroform	61	3590	.5551
Carbon bisulphide	46	2350	.3711
Glacial acetic acid	118	2530	.4031

Pounds, av.	Grams	453.59	.65 667
Kilograms	Pounds, av.	2.2046	.34 333

## NOTES ON THE USE OF LOGARITHMS.

In these tables the "characteristics" of the logarithms, or the figures before their decimal points which fix the decimal points of the numbers, have been omitted, because in ordinary chemical calculations it is usually easier to find the positions of the decimal points by simple inspection of the numbers employed than by the use of characteristics.

For example, suppose we have;

$$.4693 \text{ g. AgCl (log .67145)}$$

to be multiplied by the factor which gives the amount of chlorine in it,

$$.24738 \text{ (log .39336).}$$

The addition of the logs gives the log .06481, corresponding to the numerical figures 11610.

Now by inspection, since .24738 is nearly  $\frac{1}{4}$ , or since .4693 is nearly  $\frac{1}{2}$ , it is evident that the result must be not far from  $\frac{1}{4}$  of .4693 or  $\frac{1}{2}$  of .24738, so that the decimal point must be placed to correspond; that is, .11610.

Now if we divide the amount of chlorine by the weight of substance taken for analysis, say .2603 g. (log .41547) we have  $.06481 - .41547 = .64934$ , corresponding to the number .44601, the decimal point of which is found by inspection, since the result must be about 4 times .11610. Multiplying this by 100 we find 44.60% of chlorine. The fifth figure in this result is an uncertain one because it is derived from the datum .2603; hence it is best not to report it. In this case the trouble of interpolating for a fifth figure might have been avoided by taking four figures corresponding to the nearest logarithm.

By the use of a co-logarithm (i.e.,  $1 - \log$ ) of the division the preceding calculation may be made by a single addition:

AgCl,	.4693	log	.67145
Factor,	.24738	log	.39336
Substance,	.2603	1 - log	.58453

$$.64934 \rightarrow 44.60\%$$

An inspection of the numbers employed above shows the position of the decimal point. The result could not possibly be 4.460%.

The student who is not skilful in the use of logarithms should practice multiplications and divisions with numbers giving known results until he acquires proficiency.

The easily remembered logarithm of 2, which is .30103, is often of considerable assistance in calculations. For instance, the logarithm of the atomic weight of Mg, 24.32, is .38596; hence the log of 2 Mg is .68699 and that of  $\frac{1}{2}$  Mg is .08493.
